## 2 Number Theory

### 2.1 Euler Totient Function

```
// Time: O(√N)
map<int, int> dp; // memo
int phi(int n) {
    if (dp.count(n)) return dp[n];
    int ans = n, m = n;
    for (int i = 2; i * i <= m; i++) {
        if (m % i == 0) {
            while (m % i == 0) m /= i;
            ans = ans / i * (i - 1);
        }
    }
    if (m > 1) ans = ans / m * (m - 1);
    return dp[n] = ans;
}
```

### 2.2 Phi 1 to N

```
void phi_1_to_n(int n) {
    vector<int> phi(n + 1);
    for (int i = 0; i <= n; i++)
        phi[i] = i;
    for (int i = 2; i <= n; i++) {
        if (phi[i] == i) {
            for (int j = i; j <= n; j += i)
                phi[j] -= phi[j] / i;
        }
    }
}
```

### 2.3 Segmented Sieve

```
vector<char> segmentedSieve(ll L, ll R) {
    // generate all primes up to √R
    ll lim = sqrt(R);
    vector<char> mark(lim + 1, false);
    vector<ll> primes;
    for (ll i = 2; i <= lim; ++i) {
        if (!mark[i]) {
            primes.emplace_back(i);
            for (ll j = i * i; j <= lim; j += i) mark[j] = true;
        }
    }
    vector<char> isPrime(R - L + 1, true);
    for (ll i : primes)
        for (ll j = max(i * i, (L + i - 1) / i * i); j <=
             R; j += i)
            isPrime[j - L] = false;
    if (L == 1) isPrime[0] = false;
    return isPrime;
}
```

### 2.4 Extended GCD

```
// ax + by = gcd(a, b)
int egcd(int a, int b, int& x, int& y) {
    if (b == 0) {
        x = 1, y = 0;
        return a;
    }
    int x1, y1;
    int d = egcd(b, a % b, x1, y1);
    x = y1;
    y = x1 - y1 * (a / b);
    return d;
}
```

### 2.5 Linear Diophantine Equation

```
// ax + by = c, find any x and y
bool find_any_solution(int a, int b, int c, int &x0,
                      int &y0, int &g) {
    g = egcd(abs(a), abs(b), x0, y0);
    if (c % g) return false;
    x0 *= c / g;
    y0 *= c / g;
    if (a < 0) x0 = -x0;
    if (b < 0) y0 = -y0;
    return true;
}
void shift_solution(int &x, int &y, int a, int b, int
                    cnt) {
    x += cnt * b;
    y -= cnt * a;
}
int find_all_solutions(int a, int b, int c, int minx,
                      int maxx, int miny, int maxy) {
    int x, y, g;
    if (!find_any_solution(a, b, c, x, y, g)) return 0;
    a /= g, b /= g;
    int sign_a = a > 0 ? +1 : -1;
    int sign_b = b > 0 ? +1 : -1;
    shift_solution(x, y, a, b, (minx - x) / b);
    if (x < minx) shift_solution(x, y, a, b, sign_b);
    if (x > maxx) return 0;
    int lx1 = x;
    shift_solution(x, y, a, b, (maxx - x) / b);
    if (x > maxx) shift_solution(x, y, a, b, -sign_b);
    int rx1 = x;
    shift_solution(x, y, a, b, -(miny - y) / a);
    if (y < miny) shift_solution(x, y, a, b, -sign_a);
    if (y > maxy) return 0;
    int lx2 = x;
    shift_solution(x, y, a, b, -(maxy - y) / a);
    if (y > maxy) shift_solution(x, y, a, b, sign_a);
    int rx2 = x;
    if (lx2 > rx2) swap(lx2, rx2);
    int lx = max(lx1, lx2);
    int rx = min(rx1, rx2);
    if (lx > rx) return 0;
    return (rx - lx) / abs(b) + 1;
}
```

### 2.6 Modular Inverse using EGCD

```
// finding inverse(a) modulo m
int x, y;
int g = extended_euclidean(a, m, x, y);
if (g != 1) cout << "No solution!";
else {
    x = (x % m + m) % m;
    cout << x << endl;
}
```

### 2.7 Exclusion DP

```
ll f[N], g[N];
for (int i = N - 1; i >= 1; i--) {
    f[i] = nC4(div_cnt[i]);
    g[i] = f[i];
    for (int j = i + 1; j < N; j += i) {
        g[i] -= g[j];
    }
}
```

- Here,  $f[i]$  = how many pairs/k-tuple such that their gcd is  $i$  or it's multiple (count of pairs those are divisible by  $i$ ).

- $g[i]$  = how many pairs/k-tuple such that their gcd is  $i$ .

- $g[i] = f[i] - \sum_{i|j} g[j]$ .

- **Sum of all pair gcd:**

We know, how many pairs are there such that their gcd is  $i$  for every  $i$  (1 to  $n$ ). So now,  $\sum_{i=1}^n g[i] * i$ .

- **Sum of all pair lcm** ( $1 \leq i, j \leq n$ ): We know,  $\text{lcm}(a, b) = \frac{a*b}{\text{gcd}(a, b)}$ .

- Now,  $f[i]$  = All pair product sum of those, whose gcd is  $i$  or it's multiple.

- $g[i]$  = All pair product sum of those, whose gcd is  $i$ .

$$\text{Ans} = \sum_{i=1}^n \frac{g[i]}{i}$$

$$\text{All pair product sum} = (a_1 + a_2 + \dots + a_n) * (a_1 + a_2 + \dots + a_n)$$

### 2.8 Legendres Formula

```
//  $\frac{n!}{p^x}$  - you will get the largest x
int legendre(int n, int p) {
    int ex = 0;
    while (n) {
        ex += (n / p);
        n /= p;
    }
    return ex;
}
```

### 2.9 Binary Expo

```
int power(int x, long long n, int mod) {
    int ans = 1 % mod;
    while (n > 0) {
        if (n & 1) {
            ans = 1LL * ans * x % mod;
        }
        x = 1LL * x * x % mod;
        n >>= 1;
    }
    return ans;
}
```

### 2.10 Digit Sum of 1 to N

```
// for n=10, ans = 1+2+...+9+1+0
ll solve(ll n) {
    ll res = 0, p = 1;
    while (n / p > 0) {
        ll left = n / (p * 10);
        ll cur = (n / p) % 10;
        ll right = n % p;
        res += left * 45 * p;
        res += (cur * (cur - 1) / 2) * p;
        res += cur * (right + 1);
        p *= 10;
    }
    return res;
}
```

**2.11 Pollard Rho**

```

namespace PollardRho {
mt19937 rnd(chrono::steady_clock::now().time_since_epoch_
    .count());
const int P = 1e6 + 9;
ll seq[P];
int primes[P], spf[P];

    if (m == 1) return 1;
    return power(a[1], f(l + 1, r, phi(m)), m);
}

```

**2.14 Formula and Properties**

- $\phi(n) = n \cdot \frac{p_1-1}{p_1} \cdot \frac{p_2-1}{p_2} \dots$
- $\phi(p^e) = p^e - \frac{p^e}{p} = p^e \cdot \frac{p-1}{p}$
- For  $n > 2$ ,  $\phi(n)$  is always even.
- $\sum_{d|n} \phi(d) = n$
- NOD:  $(e_1 + 1) \cdot (e_2 + 1) \dots$
- SOD:  $\frac{p_1^{e_1+1}-1}{p_1-1} \cdot \frac{p_2^{e_2+1}-1}{p_2-1} \dots$
- $\log(a \cdot b) = \log(a) + \log(b)$
- $\log(a^x) = x \cdot \log(a)$
- $\log_a(x) = \frac{\log_b(x)}{\log_b(a)}$
- Digit Count of n:  $\lfloor \log_{10}(n) \rfloor + 1$
- Arithmetic Progression Sum:  $\frac{n}{2} \cdot (a + p), \quad \frac{n}{2} \cdot (2a + (n-1)d)$
- Geometric Sum:  $S_n = a \cdot \frac{r^n - 1}{r - 1}$
- $(1^2 + 2^2 + \dots + n^2) = \frac{n(n+1)(2n+1)}{6}$
- $(1^3 + 2^3 + \dots + n^3) = \frac{n^2(n+1)^2}{4}$
- $(2^2 + 4^2 + \dots + (2n)^2) = \frac{2n(n+1)(2n+1)}{3}$
- $(1^2 + 3^2 + \dots + (2n-1)^2) = \frac{n(2n-1)(2n+1)}{3}$
- $(2^3 + 4^3 + \dots + (2n)^3) = 2n^2(n+1)^2$
- $(1^3 + 3^3 + \dots + (2n-1)^3) = n^2(2n^2 - 1)$
- For any number  $n$  and bases  $> \sqrt{n}$ , there will be no representation where the number contains 0 at its second least significant digit. So it is enough to check for bases  $\leq \sqrt{n}$ .
- For some  $x$  and  $y$ , let's try to find all  $m$  such that  $x \bmod m \equiv y \bmod m$ . We can rearrange the equation into  $(x - y) \equiv 0 \pmod{m}$ . Thus, if  $m$  is a factor of  $|x - y|$ , then  $x$  and  $y$  will be equal modulo  $m$ .

**3 Combinatorics and Probability****3.1 Combinations**

```

// Prime Mod in O(n)
void prec() {
    fact[0] = 1;
    for (int i = 1; i < N; i++) {
        fact[i] = 1LL * fact[i - 1] * i % mod;
    }
    ifact[N - 1] = inverse(fact[N - 1]);
    for (int i = N - 2; i >= 0; i--) {
        ifact[i] = 1LL * ifact[i + 1] * (i + 1) % mod;
    }
}

int nCr(int n, int r) {
    if (r > n) return 0;
    return 1LL * fact[n] * ifact[r] % mod * ifact[n - r]
        % mod;
}

int nPr(int n, int r) {
    if (r > n) return 0;
    return 1LL * fact[n] * ifact[n - r] % mod;
}

```

### 3.2 nCr for any mod

```
// Time: O(n^2)
// nCr = (n-1)C(r-1) + (n-1)Cr
for (int i = 0; i < N; i++) {
    C[i][i] = 1;
    for (int j = 0; j < i; j++) {
        C[i][j] = (C[i - 1][j] + C[i - 1][j - 1]) % mod;
    }
}
```

### 3.3 nCr without mod in O(r)

```
ll nCk(ll n, ll k) {
    double res = 1;
    for (ll i = 1; i <= k; ++i)
        res = res * (n - k + i) / i;
    return (ll)(res + 0.01);
}
```

### 3.4 Lucas Theorem

```
// returns nCr modulo mod where mod is a prime
// Complexity: ?
ll Lucas(ll n, ll r) {
    if (r < 0 || r > n) return 0;
    if (r == 0 || r == n) return 1;
    if (n >= MOD) {
        return (Lucas(n / MOD, r / MOD) % MOD * Lucas(n % MOD, r % MOD) % MOD) % MOD;
    }
    return ((fact[n] * invFact[r]) % MOD) * invFact[n - r] % MOD;
}
```

### 3.5 Catalan Number

```
const int MOD = 1e9 + 7, int MAX = 1e7;
int catalan[MAX];
void init(ll n) {
    catalan[0] = catalan[1] = 1;
    for (ll i = 2; i <= n; i++) {
        catalan[i] = 0;
        for (ll j = 0; j < i; j++) {
            catalan[i] += (catalan[j] * catalan[i - j - 1]) % MOD;
        }
        if (catalan[i] >= MOD) {
            catalan[i] -= MOD;
        }
    }
}
```

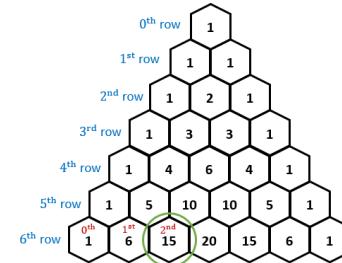

### 3.6 Derangement

```
// number of combinations such that a_i! = i of a
// permutation a
const int N = 1e6 + 100, int p = 1e9 + 7;
ll der[N];
void countDer() {
    der[1] = 0; der[2] = 1;
    for (ll i = 3; i <= N; ++i) {
        der[i] = (i - 1) % p * (der[i - 1] % p + der[i - 2] % p);
        der[i] %= p;
    }
}
```

### 3.7 Stars and Bars Theorem

- Find the number of  $k$ -tuples of non-negative integers whose sum is  $n$ .  $\binom{n+k-1}{n}$
- Find the number of  $k$ -tuples of non-negative integers whose sum is  $\leq n$ .  $\binom{n+k}{k}$
- Combination with Repetition (choose  $k$  elements from  $n$  objects, same element can be chosen multiple times).  $\binom{n+k-1}{k}$
- How many ways to go from  $(0, 0)$  to  $(n, m)$ .  $\binom{n+m}{m}$

Pascals Triangle is equivalent to nCr:

### 3.8 Properties of Pascal's Triangle

- $(a+b)^n = \sum_{k=0}^n \binom{n}{k} a^k b^{n-k}$
- $(k+1)^n = \sum_{i=0}^n k^i \cdot \binom{n}{i}$
- $\sum_{i=0}^n \binom{n}{i} = 2^n$
- $\binom{n}{k} = \frac{n}{k} \binom{n-1}{k-1}$
- $\sum_{k=0}^m \binom{n+k}{k} = \binom{n+m+1}{m}$
- $\binom{n}{0}^2 + \binom{n}{1}^2 + \dots + \binom{n}{n}^2 = \binom{2n}{n}$
- $1\binom{n}{1} + 2\binom{n}{2} + \dots + n\binom{n}{n} = n2^{n-1}$

### 3.9 Contribution Technique

- Sum of all pair sums:  $\sum_{i=1}^n \sum_{j=1}^n (a_i + a_j)$   
Every element will be added  $2n$  times.  $\sum_{i=1}^n (2 \times n \times a_i) = 2 \times n \times \sum_{i=1}^n a_i$ .
- Sum of all subarray sums —  $\sum_{i=1}^n (a_i \times i \times (n - i + 1))$ .
- Sum of all Subsets sums —  $\sum_{i=1}^n (2^{n-1} \times a_i)$ .
- Product of all pair product —  $\prod_{i=1}^n (a_i^{2 \times n})$ .
- XOR of subarray XORS — How many subarrays does an element have? ( $i \cdot (n - i + 1)$  times). If subarray count is odd then this element can contribute in total XORs.
- Sum of max minus min over all subset — Sort the array.  $Min = 2^{n-i}$ ,  $Max = 2^{i-1}$ .  $\sum_{i=1}^n (a_i \cdot 2^{i-1} - a_i \cdot 2^{n-i})$
- Sum using bits —  $\sum_{k=0}^30 (cnt_k[1] \times 2^k)$ .
- Sum of Pair XORS — XOR will 1 if two bits are different  $\sum_{k=0}^30 (cnt_k[0] \times cnt_k[1] \times 2^k)$ .
- Sum of Pair ANDs —  $\sum_{k=0}^30 (cnt_k[1]^2 \times 2^k)$ .
- Sum of Pair ORs —  $\sum_{k=0}^30 ((cnt_k[1]^2 + 2 \times cnt_k[1] \times cnt_k[0]) \times 2^k)$ .

- Sum of Subset XORs — where  $cnt0! = 0$   
 $\sum_{k=0}^30 (2^{cnt_k[1]+cnt_k[0]-1} \times 2^k)$ .
- Sum of Subset ANDs —  $\sum_{k=0}^30 ((2^{cnt_k[1]} - 1) \times 2^k)$ .
- Sum of Subset ORs —  $\sum_{k=0}^30 ((2^{n-2^{cnt_k[0]}}) \times 2^k)$ .
- Sum of subarray XORs — Convert to prefix xor, then solve for pairs.
- Sum of product of all subsequence —  $\prod_{i=1}^n (a_i + 1) - 1$ . Example array —  $[a, b]$  the subsequences are  $\{a\}, \{b\}, \{a, b\}$  so ans is  $a + b + (a \cdot b)$

### 3.10 Probability and Expected Value

- Expected Value:  $E = \frac{\text{Sum of all possible values}}{\text{Total number of outcomes}}$
- Expected Value:  $E = \sum_{i=1}^n P_i \cdot i$
- Variance:  $V(x) = E(x^2) - \{E(x)\}^2$
- Expected Value with DP:  $E(i) = \sum P(i \rightarrow j) \times (R(i \rightarrow j) + E(j))$  Where  $R()$  is Immediate Reward(cost/count)
- Linearity of Expectation:
  - $E[X + Y] = E[X] + E[Y]$
  - $E[\text{Total}] = E[I_1] + E[I_2] + \dots = \sum P(I_i = 1)$

We need to define the Indicator Random Variable ( $I$ ) correctly. Some Examples below —

**Problem-1:** Find  $E[\text{correct hats}]$  in a random permutation. Indicator  $I_{ij}$ : "Does person  $i$  get their own hat?"

**Problem-2:** Find  $E[\text{total inversions}]$  in a random permutation. Indicator  $I_{ij}$ : "Is pair  $(i, j)$  an inversion?"

**Problem-3:** Given a string  $S$ , delete a random index until it becomes empty. Find the expected count of palindromes seen (exclude  $S$ , include empty string). Indicator  $I_L$ : "Is the string of length  $L$  a palindrome?"

**Problem-4:** Pick  $N$  random integers from  $[1, k]$ . Merge consecutive equal values (e.g.,  $1, 1, 2, 2, 1, 1 \rightarrow 1, 2, 1$ ). Find the expected final length. Indicator  $I_i$ : "Is item  $i$  different from item  $i - 1$ ?"

- To get two consecutive heads, what is the expected number of tosses?
 
$$E = p(h) \times [1 + p(t) \times (1 + E) + p(h) \times 1] + p(t) \times (1 + E)$$

$p(h)$  tail in the next move  
 $p(t)$  head in the first move  
 $p(h)$  move wasted, go back to E  
 $p(t)$  made one move  
 $p(h)$  tail in the first move  
 $p(t)$  head in the next move, job done

To get  $n$  heads, what is the expected number of tosses? Let's define: to get  $n$  heads, we need to toss  $E(n)$  times. Now — I can get a head; I need to toss  $E(n-1)$  more times, or if I get a tail; I need to toss  $E(n)$  times. So, the recurrence is:  $E(n) = 0.5 \cdot (1 + E(n-1)) + 0.5 \cdot (1 + E(n))$

You have  $n$  bulbs, all of which are initially off. In each move, you randomly select one bulb. If the selected bulb is off, you toss a coin:
 

- If you get head, you turn it on.
- If you get tail, you do nothing.

If the bulb is already on, you skip that move (nothing happens). Now, what is the expected number of moves required to turn all bulbs on?

The coin is not fair — the probability of getting tail is  $p$ . This problem can also be solved recursively.

Let's assume at some moment,  $x$  bulbs are already on, and the expected number of moves needed from here is  $e(x)$ .

The probability of picking an already on bulb is  $\frac{x}{n}$ . In that case, the expected number of moves is  $\frac{x}{n} \times (1 + e(x))$ .

The probability of picking an off bulb is  $\frac{n-x}{n}$ .

Now two things can happen:

- With probability  $p$ , you get tail, so you stay at the same state ( $e(x)$  more moves).
- With probability  $(1-p)$ , you get head, so one more bulb turns on ( $e(x+1)$  moves from there).

So, the recurrence relation is:

$$e(x) = \frac{x}{n}(1 + e(x)) + \frac{n-x}{n}(p(1 + e(x)) + (1-p)(1 + e(x+1)))$$

### 3.11 Stirling Number of the First Kind

- Count permutation according to their number of cycles.
- $S(n, k)$  counts the number of permutations of  $n$  elements with  $k$  disjoint cycles.
- $S(n, k) = (n-1)S(n-1, k) + S(n-1, k-1)$ ,  $S(0, 0) = 1$ ,  $S(n, 0) = S(0, n) = 0$
- $S(n, 1) = (n-1)!$
- $S(n, n-1) = \binom{n}{2}$
- $\sum_{k=0}^n S(n, k) = n!$

### 3.12 Stirling Number of the Second Kind

- Number of ways to partition a set of  $n$  objects into  $k$  non-empty subsets.
- $S(n, k) = k S(n-1, k) + S(n-1, k-1)$ ,  $S(0, 0) = 1$ ,  $S(n, 0) = S(0, n) = 0$
- $S(n, 2) = 2^{n-1} - 1$
- $S(n, k) = \frac{1}{k!} \sum_{j=0}^k (-1)^{k-j} \binom{k}{j} j^n$
- $S(n, k) \cdot k!$  = number of ways to color  $n$  nodes using colors from 1 to  $k$  such that each color is used at least once.

## 4 Data Structure

### 4.1 Next Greater using Stack

```
stack<pair<int, int>> st;
int right[n + 1]; // a[i] is maximum from index i to
right[i]
for (int i = 1; i <= n; i++) {
    while (!st.empty() and st.top().first < a[i]) {
        right[st.top().second] = i - 1;
        st.pop();
    }
    st.push({a[i], i});
}
while (!st.empty()) {
    right[st.top().second] = n;
    st.pop();
}
```

### 4.2 Segment Tree Lazy

```
struct ST {
    int tree[4 * N], lazy[4 * N];
    void push(int n, int b, int e) {
        if (lazy[n] == 0) return;
        tree[n] += lazy[n] * (e - b + 1); // change here
        if (b != e) {
            int l = n << 1, r = l + 1;
            lazy[l] += lazy[n]; // change here
            lazy[r] += lazy[n]; // change here
        }
        lazy[n] = 0;
    }
    void build(int n, int b, int e) {
        lazy[n] = 0;
        if (b == e) {
            tree[n] = a[b]; // change here
            return;
        }
        int mid = (b + e) >> 1, l = n << 1, r = l + 1;
        build(l, b, mid);
        build(r, mid + 1, e);
        tree[n] = tree[l] + tree[r]; // change here
    }
    void upd(int n, int b, int e, int i, int j, int x) {
        push(n, b, e);
        if (b > j || e < i) return;
        if (b >= i && e <= j) {
            lazy[n] += x; // change here
            push(n, b, e);
            return;
        }
        int mid = (b + e) >> 1, l = n << 1, r = l + 1;
        upd(l, b, mid, i, j, x);
        upd(r, mid + 1, e, i, j, x);
        tree[n] = tree[l] + tree[r]; // change here
    }
    int query(int n, int b, int e, int i, int j) {
        push(n, b, e);
        if (b > j || e < i) return 0; // return appropriate
        value
        if (b >= i && e <= j) return tree[n];
        int mid = (b + e) >> 1, l = n << 1, r = l + 1;
        int L = query(l, b, mid, i, j);
        int R = query(r, mid + 1, e, i, j);
        return L + R; // change here
    }
} st;
```

### 4.3 First Element Greater than K in a Range

```
// tree[n] = max in range
int get_first(int n, int b, int e, int i, int j, int x) {
    // return index
    push(n, b, e);
    if (b > j || e < i) return -1;
    if (tree[n] <= x) return -1;
    if (b == e) return b;
    int mid = (b + e) >> 1, l = n << 1, r = l + 1;
    int left = get_first(l, b, mid, i, j, x);
    if (left != -1) return left;
    return get_first(r, mid + 1, e, i, j, x);
}
```

### 4.4 Number of Unique Element in a Range

```
vector<pair<int, int>> Q[QQ];
```

```
int main() {
    int n; cin >> n;
    for (int i = 1; i <= n; i++) cin >> a[i];
    int q; cin >> q;
    for (int i = 1; i <= q; i++) {
        int l, r; cin >> l >> r;
        Q[r].push_back({l, i});
    }
    st.build(1, 1, n); // range sum and point add
    map<int, int> last_idx;
    for (int r = 1; r <= n; r++) {
        if (last_idx.find(a[r]) != last_idx.end()) {
            st.upd(1, 1, n, last_idx[a[r]], -1);
        }
        last_idx[a[r]] = r;
        st.upd(1, 1, n, r, 1);
        for (auto i : Q[r]) {
            int l = i.first, id = i.second;
            ans[id] = st.query(1, 1, n, l, r);
        }
    }
}
```

### 4.5 Max Subarray Sum in a Range

```
struct node {
    ll tot_sum;
    ll prefix_max, suffix_max;
    ll max_subarray_sum;
};
node merge(node l, node r) {
    if (l.tot_sum == -inf) return r;
    if (r.tot_sum == -inf) return l;
    node ans;
    ans.max_subarray_sum = max(l.max_subarray_sum,
        r.max_subarray_sum);
    ans.max_subarray_sum = max(ans.max_subarray_sum,
        l.suffix_max + r.prefix_max);
    ans.tot_sum = l.tot_sum + r.tot_sum;
    ans.prefix_max = l.prefix_max;
    if (l.tot_sum + r.prefix_max >= l.prefix_max) {
        ans.prefix_max = l.tot_sum + r.prefix_max;
    }
    ans.suffix_max = r.suffix_max;
    if (r.tot_sum + l.suffix_max >= r.suffix_max) {
        ans.suffix_max = r.tot_sum + l.suffix_max;
    }
    return ans;
}
```

### 4.6 Count of subarrays such that their XOR is 0 in a range with upd

```
struct node {
    int cnt[64];
    node() {
        memset(cnt, 0, sizeof cnt);
    }
};
struct ST {
    node tree[4 * N]; int lazy[4 * N];
    void push(int n, int b, int e) {
        if (lazy[n] == 0) return;
        for (int k = 0; k < 64; k++) {
            if ((k ^ lazy[n]) > k) {
                swap(tree[n].cnt[k], tree[n].cnt[k ^ lazy[n]]);
            }
        }
    }
};
```

```

}
if (b != e) {
    int l = n << 1, r = l + 1;
    lazy[1] ^= lazy[n];
    lazy[r] ^= lazy[n];
}
lazy[n] = 0;
}

node merge(node a, node b) {
    for (int k = 0; k < 64; k++) a.cnt[k] += b.cnt[k];
    return a;
}

void build(int n, int b, int e) {
    lazy[n] = 0;
    if (b == e) {
        tree[n].cnt[0] = 1;
        return;
    }
    int mid = (b + e) >> 1, l = n << 1, r = l + 1;
    build(l, b, mid);
    build(r, mid + 1, e);
    tree[n] = merge(tree[l], tree[r]);
}

void upd(int n, int b, int e, int i, int j, int x) {
    push(n, b, e);
    if (b > j || e < i) return;
    if (b >= i && e <= j) {
        lazy[n] ^= x; push(n, b, e);
        return;
    }
    int mid = (b + e) >> 1, l = n << 1, r = l + 1;
    upd(l, b, mid, i, j, x);
    upd(r, mid + 1, e, i, j, x);
    tree[n] = merge(tree[l], tree[r]);
}

node query(int n, int b, int e, int i, int j) {
    push(n, b, e);
    if (b > j || e < i) {
        node tmp; return tmp;
    }
    if (b >= i && e <= j) return tree[n];
    int mid = (b + e) >> 1, l = n << 1, r = l + 1;
    node L = query(l, b, mid, i, j);
    node R = query(r, mid + 1, e, i, j);
    return merge(L, R);
}

} st;
int32_t main() {
    string s; cin >> s;
    int n = s.size();
    s = '.' + s;
    st.build(1, 1, n);
    for (int i = 1; i <= n; i++) {
        int x = (1 << (s[i] - 'a'));
        st.upd(1, 1, n, i, n, x); // segtree contains prefix xor
    }
    int q; cin >> q;
    while (q--) {
        int type; cin >> type;
        if (type == 1) {
            int l, r; cin >> l >> r;
            node tmp = st.query(1, 1, n, l - 1, r);
            ll ans = 0;
            for (int k = 0; k < 64; k++) {

```

```

                int x = tmp.cnt[k];
                if (l == 1 and k == 0) x++;
                ans += (1ll * x * (x - 1)) / 2;
            }
            cout << ans << '\n';
        }
        else {
            int i; cin >> i;
            char c; cin >> c;
            int mask = (1 << (s[i] - 'a'));
            mask ^= (1 << (c - 'a'));
            st.upd(1, 1, n, i, n, mask);
            s[i] = c;
        }
    }
}

### 4.7 Range Add, Set and Sum

---

```

// Problem: Range Updates and Sums - CSES
struct ST {
    int tree[4 * N];
    pair<int, int> lazy[4 * N]; // val, types
    // lazy[n].first = 0; default for all n
    // lazy[n].second = -1; default for all n
    void push(int n, int b, int e) {
        if (lazy[n].first == 0) return;
        if (lazy[n].second == 1) { // set
            tree[n] = lazy[n].first * (e - b + 1);
        }
        else { // add

## 6.12 [Problem] Rooted Tree - Hackerrank

Given a rooted tree, Upd: Add  $d \cdot k$  on  $v$ (subtree nodes of  $u$ ), where  $k$  will be given and  $d$  is distance of  $v$  from  $u$ . Query: Node Value/Subtree Sum (using ETT) or Path Value Sum (using HLD). Idea:  $d_i$  = dis from root to  $i$ . Then,  $\text{ans} = k \cdot \sum_{v \in \text{subtree}(u)} d_v$ . It's hard to find  $d_v$  for each  $u$ , rather we can find  $d_v$  = dis of  $v$  from root. Although some extra value added on each  $v$  of subtree  $u$  because of  $d_v$  from root (not  $u$ ), we can easily subtract them ( $\text{depth}[u] \cdot k$ ).

        cnt = t3.GT(l + 1, m, k);
        ans += 1ll * k * cnt;
    }
    k = 1 + r;
    ans += -f(m + 1, r);
    ans += t4.sum(m + 1, r, k);
    cnt = t4.GT(m + 1, r, k);
    ans += 1ll * k * cnt;
    cout << ans << '\n';
}
```

It is easier to explain by considering only palindromes centered at indices (so, odd length), the idea is the same anyway. For each index  $i$ ,  $r_i$  will be the longest radius of a palindrome centered there (in other words, the amount of palindromes centered at index  $i$ ). Directly from manacher, this takes  $\mathcal{O}(n)$  to calculate.

For a query  $[l, r]$ , we first compute  $m = \frac{l+r}{2}$ . Now we want to calculate

$$\sum_{i=l}^m \min(i - l + 1, r_i) + \sum_{i=m+1}^r \min(r - i + 1, r_i)$$

$$\sum_{i=l}^m \min(i - l + 1, r_i) = \sum_{i=l}^m i + \min(1 - l, r_i - i).$$

The sum over  $i$  can be found in constant time. As for the other term, if we create some array  $r'_i = r_i - i$  during the preprocessing, then the queries are asking for some over range of  $\min(C, r'_i)$  where  $C$  is constant. You can solve this in  $\mathcal{O}(\log n)$  per query using wavelet tree.

**7.10 Trie**

```

const int N = 10; // change here
const char base_char = '0'; // change here
struct TrieNode {
    int cnt;
    TrieNode *nxt[N];
    TrieNode() {
        cnt = 0;
        for (int i = 0; i < N; i++) nxt[i] = NULL;
    }
} *root;
void insert(const string &s) {
    TrieNode *cur = root;
    int n = (int)s.size();
    for (int i = 0; i < n; i++) {
        int idx = s[i] - base_char;
        if (cur -> nxt[idx] == NULL) cur -> nxt[idx] = new TrieNode();
        cur = cur -> nxt[idx];
        cur -> cnt++;
    }
}
void rem(TrieNode *cur, string &s, int pos) { // free :: De Alloactes Memory
    if (pos == s.size()) return;
    int idx = s[pos] - base_char;
    rem(cur -> nxt[idx], s, pos + 1);
    cur -> nxt[idx] -> cnt--;
    if (cur -> nxt[idx] -> cnt == 0) {
        free(cur -> nxt[idx]);
        cur -> nxt[idx] = NULL;
    }
}
int query(const string &s) { // "s" is a prefix of some element or not
    int n = (int)s.size();
    TrieNode *cur = root;
    for (int i = 0; i < n; i++) {
        int idx = s[i] - base_char;
        if (cur -> nxt[idx] == NULL) return 0;
        cur = cur -> nxt[idx];
    }
    return cur -> cnt;
}
void del(TrieNode *cur) {
    for (int i = 0; i < N; i++) if (cur -> nxt[i])
        del(cur -> nxt[i]);
    delete(cur);
}
int32_t main() {
    root = new TrieNode(); // init new trie
    del(root); // clear trie
}

```

**7.11 Manachar**

```

vector<int> manacher_odd(string s) {
    int n = s.size();
    s = "$" + s + "^";
    vector<int> p(n + 2);
    int l = 0, r = 1;
    for (int i = 1; i <= n; i++) {
        p[i] = min(r - i, p[l + (r - i)]);
        while (s[i - p[i]] == s[i + p[i]]) {
            p[i]++;
        }
    }
}

```

```

        if (i + p[i] > r) {
            l = i - p[i], r = i + p[i];
        }
    }
    return vector<int>(begin(p) + 1, end(p) - 1);
}
vector<int> manacher(string s) {
    string t;
    for (auto c : s) {
        t += string("#") + c;
    }
    cout << t << '\n';
    auto res = manacher_odd(t + "#");
    return vector<int>(begin(res) + 1, end(res) - 1);
}

```

**8 Game Theory****8.1 Notes**

- First Write a Bruteforce Solution
- If game is not impartial. Greedy, DP may work
- Nim = All XOR
- Misere Nim (Last player who took a stone loses) = Nim + (Corner Case: if all (odd) piles are 1 you lose)
- Bogus Nim = Nim
- Staircase Nim (Given an array where  $a[i]$  is the number of stones at index  $i$ . Move: Choose any stones ( $> 1$ ) from index  $i$  ( $i > 1$ ) and move them to index  $i - 1$ . ) = Odd indexed pile Nim (Even indexed pile doesnt matter, as one player can give bogus moves to drop all even piles to ground)
- **Sprague-Grundy:** Every impartial game under the normal play convention is equivalent to a ONE-HEAP GAME of NIM. Grundy value can be calculate by DP/Pattern.

**9 Misc.****9.1 [Trick] Median of Medians**

**Problem:** Median of All Sub-Array Medians

**Idea:** Total Subarray,  $k = \frac{n(n+1)}{2}$ . We need all subarray medians, sort them and get  $\frac{k}{2} + 1$ . Now, Binary Search on Answer. ok() will return true if  $cnt \geq \frac{k}{2} + 1$ , where  $cnt$  = count of subarrays whose median is  $\leq mid$ . If true,  $r = mid - 1$

**9.2 Ternary Search**

```

// Problem: Pyramid-ICPC Dhaka 2023
// Given the surface area of a square base pyramid, Need to maximize volume.
double suface_area;
double fun(double square_area) {
    double base = sqrt(square_area);
    double triangle_area = suface_area - square_area;

```

```

    double per_triangle_area = triangle_area / 4;
    double triangle_height = (per_triangle_area * 2) / base;
    double x = base / 2;
    double height = sqrt((triangle_height * triangle_height) - (x * x));
    double volume = (base * base * height) / 3;
    if (x > triangle_height) volume = 0;
    return volume;
}
int32_t main() {
    cin >> suface_area;
    double l = 0, r = suface_area, ans = -1;
    int it = 100;
    while (it--) {
        double mid1 = l + (r - l) / 3;
        double mid2 = r - (r - l) / 3;
        double x = fun(mid1);
        double y = fun(mid2);
        if (x > y) {
            ans = x;
            r = mid2;
        } else l = mid1;
    }
}

```

**9.3 Pigeonhole Principle**

- At least 1 subarray of an array of length  $N$  must be divisible by  $N$ .
- Build all possible sequences of length 10 whose value is between 1 to 100. At least any two sequences will be same.
- For  $N \geq 100$ , at least one 4-tuples XOR is 0.
- For  $N > 20$  and  $a_i \leq 10^6$ , at least two subsets has same XOR. Because distinct XOR count can be  $10^6$  and Total Subset  $2^{20} > 10^6$ . Means there is a subset whose XOR is 0.

**9.4 Matrix Expo**

```

struct Mat {
    int n, m;
    vector<vector<int>> a;
    Mat() { }
    Mat(int _n, int _m) { n = _n; m = _m; a.assign(n,
        vector<int>(m, 0)); }
    Mat(vector<vector<int>> v) { n = v.size(); m = n ? v[0].size() : 0; a = v; }

            >> x; // add x on this rectangle
        d[x1][y1] += x;
        d[x1][y2 + 1] -= x;
        d[x2 + 1][y1] -= x;
        d[x2 + 1][y2 + 1] += x;
    }
    for (int i = 1; i <= n; i++) {
        for (int j = 1; j <= m; j++) {
            d[i][j] += d[i - 1][j] + d[i][j - 1] - d[i - 1][j - 1];
        }
    }
    // new updated array
    for (int i = 1; i <= n; i++) {
        for (int j = 1; j <= m; j++) {
            cout << d[i][j] + a[i][j] << ' ';
        }
        cout << '\n';
    }
}

```

## 9.7 CHECK SET CLR

```

bool CHECK(int N, int pos) { return (bool)(N & (1ll << pos)); }
void SET(int &N, int pos) { (N |= (1ll << pos)); }
void CLR(int &N, int pos) { (N &= ~ (1ll << pos)); }

```

## 9.8 Graph Directions

```

int dx[] = {+0, +0, +1, -1, -1, +1, -1, +1};
int dy[] = {-1, +1, +0, +0, +1, +1, -1, -1};

```

## 9.9 Custom Hash

```

struct custom_hash {
    static uint64_t splitmix64(uint64_t x) {
        x += 0x9e3779b97f4a7c15;
        x = (x ^ (x >> 30)) * 0xbff58476d1ce4e5b9;
        x = (x ^ (x >> 27)) * 0x94d049bb133111eb;
        return x ^ (x >> 31);
    }
    size_t operator()(uint64_t x) const {
        static const uint64_t FIXED_RANDOM = chrono::steady_clock::now().time_since_epoch().count();
        return splitmix64(x + FIXED_RANDOM);
    }
};

```

## 9.10 Coordinate Compression

```

int32_t main() {
    vector<int> a({100, 9, 10, 10, 9});
    vector<int> v = a;
    sort(v.begin(), v.end());
    v.resize(unique(v.begin(), v.end()) - v.begin());
    for (int i = 0; i < a.size(); i++) {
        a[i] = lower_bound(v.begin(), v.end(), a[i]) -
            v.begin() + 1;
    }
}

```

## 9.11 Submask Generator

```

int mask = 0; // any value
for (int submask = mask; submask; submask = (submask - 1) & mask) {}

```

## 9.12 Custom Comparators

```

bool cmp(pair<int, int> a, pair<int, int> b) { // for
vector, arr, ..
if (a.first != b.first) return a.first > b.first;
return a.second < b.second; // must return false for
equal elements
}
struct cmp { // for set, map, pq, ..
bool operator()(const int& a, const int& b) const {
    return a > b;
}
};

```

## 9.13 MOD Operations

```

inline ll modAdd(ll a, ll b, ll MOD) {ll res = a + b;
res += ((res >> 63) & MOD); if (res >= MOD) res -=
MOD; return res;}
inline ll modSub(ll a, ll b, ll MOD) {ll res = a - b;
res += ((res >> 63) & MOD); if (res >= MOD) res -=
MOD; return res;}
inline ll modMul(ll a, ll b, ll MOD) {a %= MOD; b %
MOD; a += ((a >> 63) & MOD); b += ((b >> 63) &
MOD); return (a * b) % MOD;}
inline ll modInverse(ll a, ll MOD) {return modPow(a,
MOD - 2, MOD);}
inline ll modDiv(ll a, ll b, ll MOD) {return modMul(a,
modInverse(b, MOD), MOD);}
inline ll modMulBigMod(ll a, ll b, ll MOD) {a %= MOD; b %
MOD; a += ((a >> 63) & MOD); b += ((b >> 63) &
MOD); return (1l)((__int128)a * b % MOD);}

```

## 9.14 Mex with Array Updates

```

int32_t main() {
    int n, q; cin >> n >> q;
    set<int> missing_numbers;
    for (int i = 0; i <= n + 200; i++) {
        missing_numbers.insert(i);
    }
