3 Number Theory	
3.1 Euler Totient Function	
// Time: $O(\sqrt{N})$ map<int, int> dp; // memo int phi(int n) { if (dp.count(n)) return dp[n]; int ans = n, m = n; for (int i = 2; i * i <= m; i++) { if (m % i == 0) { while (m % i == 0) m /= i; ans = ans / i * (i - 1); } } if (m > 1) ans = ans / m * (m - 1); return dp[n] = ans; }	
3.2 Phi 1 to N	
void phi_1_to_n(int n) { vector<int> phi(n + 1); for (int i = 0; i <= n; i++) phi[i] = i; for (int i = 2; i <= n; i++) { if (phi[i] == i) { for (int j = i; j <= n; j += i) phi[j] -= phi[j] / i; } } }	
3.3 Segmented Sieve	
vector<char> segmentedSieve(ll L, ll R) { // generate all primes up to \sqrt{R} ll lim = sqrt(R); vector<char> mark(lim + 1, false); vector<ll> primes; for (ll i = 2; i <= lim; ++i) { if (!mark[i]) { primes.emplace_back(i); for (ll j = i * i; j <= lim; j += i) mark[j] = true; } } vector<char> isPrime(R - L + 1, true); for (ll i : primes) for (ll j = max(i * i, (L + i - 1) / i * i); j <= R; j += i) isPrime[j - L] = false; if (L == 1) isPrime[0] = false; return isPrime; }	
3.4 Extended GCD	
// $ax + by = \gcd(a, b)$ int egcd(int a, int b, int& x, int& y) { if (b == 0) { x = 1, y = 0; return a; } int x1, y1; int d = egcd(b, a % b, x1, y1); x = y1; y = x1 - y1 * (a / b); return d; }	

3.5 Linear Diophantine Equation

```
// ax + by = c, find any x and y
bool find_any_solution(int a, int b, int
c, int &x0, int &y0, int &g) {
    g = egcd(abs(a), abs(b), x0, y0);
    if (c % g) return false;
    x0 *= c / g;
    y0 *= c / g;
    if (a < 0) x0 = -x0;
    if (b < 0) y0 = -y0;
    return true;
}

void shift_solution(int &x, int &y,
int a, int b, int cnt) {
    x += cnt * b;
    y -= cnt * a;
}

int find_all_solutions(int a, int b, int
c, int minx, int maxx, int miny, int
maxy) {
    int x, y, g;
    if (!find_any_solution(a, b, c, x, y,
        g)) return 0;
    a /= g, b /= g;
    int sign_a = a > 0 ? +1 : -1;
    int sign_b = b > 0 ? +1 : -1;
    shift_solution(x, y, a, b, (minx - x)
        / b);
    if (x < minx) shift_solution(x, y, a,
        b, sign_b);
    if (x > maxx) return 0;
    int lx1 = x;
    shift_solution(x, y, a, b, (maxx - x)
        / b);
    if (x > maxx) shift_solution(x, y, a,
        b, -sign_b);
    int rx1 = x;
    shift_solution(x, y, a, b, -(miny - y)
        / a);
    if (y < miny) shift_solution(x, y, a,
        b, -sign_a);
    if (y > maxy) return 0;
    int lx2 = x;
    shift_solution(x, y, a, b, -(maxy - y)
        / a);
    if (y > maxy) shift_solution(x, y, a,
        b, sign_a);
    int rx2 = x;
    if (lx2 > rx2) swap(lx2, rx2);
    int lx = max(lx1, lx2);
    int rx = min(rx1, rx2);
    if (lx > rx) return 0;
    return (rx - lx) / abs(b) + 1;
}
```

3.6 Modular Inverse using EGCD

```
// finding inverse(a) modulo m
int x, y;
int g = extended_euclidean(a, m, x, y);
if (g != 1) cout << "No solution!";
else {
    x = (x % m + m) % m;
    cout << x << endl;
}
```

3.7 Exclusion DP

```
ll f[N], g[N];
for (int i = N - 1; i >= 1; i--) {
    f[i] = nC4(div_cnt[i]);
    g[i] = f[i];
    for (int j = i + 1; j < N; j += i) {
        g[i] -= g[j];
    }
}
```

Here, $f[i]$ = how many pairs/k-tuple such that their gcd is i or it's multiple (count of pairs those are divisible by i).

$g[i]$ = how many pairs/k-tuple such that their gcd is i .

$g[i] = f[i] - \sum_{j|i} g[j]$.

We know how many pairs are there such that their gcd is i for every i (1 to n). So now, $\sum_{i=1}^n g[i]*i$.

Sum of all pair lcm ($i = 1, j = 1$): We know, $\text{lcm}(a, b) = \frac{ab}{\text{gcd}(a, b)}$.

Now, $f[i]$ = All pair product sum of those, whose gcd is i or it's multiple.

$g[i]$ = All pair product sum of those, whose gcd is i .

Ans = $\sum_{i=1}^n \frac{g[i]}{i}$.

All pair product sum = $(a_1 + a_2 + \dots + a_n) * (a_1 + a_2 + \dots + a_n)$

3.8 Legendres Formula

```
//  $\frac{n!}{p^x}$  - you will get the largest x
int legendre(int n, int p) {
    int ex = 0;
    while(n) {
        ex += (n / p);
        n /= p;
    }
    return ex;
}
```

3.9 Binary Expo

```
int power(int x, long long n, int mod) {
    int ans = 1 % mod;
    while (n > 0) {
        if (n & 1) {
            ans = 1LL * ans * x % mod;
        }
        x = 1LL * x * x % mod;
        n >>= 1;
    }
    return ans;
}
```

3.10 Digit Sum of 1 to N

```
// for n=10, ans = 1+2+...+9+1+0
ll solve(ll n) {
    ll res = 0, p = 1;
    while (n / p > 0) {
        ll left = n / (p * 10);
        ll cur = (n / p) % 10;
        ll right = n % p;
        res += left * 45 * p;
        res += (cur * (cur - 1) / 2) * p;
        res += cur * (right + 1);
        p *= 10;
    }
    return res;
}
```

3.11 Pollard Rho

```

        ans = 1LL * ans * (i / t + 1) % mod;
    }
    return ans;
}
// e contains  $e_1, e_2 \rightarrow p_1^{e_1}, p_2^{e_2}$ 
int solve_equal(vector<int> e, int t) {
    return (solve_greater_or_equal(e, t) -
        solve_greater_or_equal(e, t + 1) +
        mod) % mod;
}
```

3.13 [Problem] Power Tower - CF

```
// A sequence  $w_1, w_2, \dots, w_n$  and Q queries, l and r will be given.
Calculate  $w_{l \cdot (w_r)}$ 
//  $n^x \bmod m = n^{\phi(m)+x \bmod \phi(m)} \bmod m$ 
inline int MOD(int x, int m) {
    if (x < m) return x;
    return x % m + m;
}
int power(int n, int k, int mod) {
    int ans = MOD(1, mod);
    while (k) {
        if (k & 1) ans = MOD(ans * n, mod);
        n = MOD(n * n, mod);
        k >>= 1;
    }
    return ans;
}
int f(int l, int r, int m) {
    if (l == r) return MOD(a[l], m);
    if (m == 1) return 1;
    return power(a[l], f(l + 1, r,
        phi(m)), m);
}
```

3.14 Formula and Properties

- $\phi(n) = n \cdot \frac{p_1-1}{p_1} \cdot \frac{p_2-1}{p_2} \dots$
- $\phi(p^e) = p^e - \frac{p^e}{p} = p^e \cdot \frac{p-1}{p}$
- For $n > 2$, $\phi(n)$ is always even.
- $\sum_{d|n} \phi(d) = n$
- NOD: $(e_1 + 1) \cdot (e_2 + 1) \dots$
- SOD: $\frac{p_1^{e_1+1}-1}{p_1-1} \cdot \frac{p_2^{e_2+1}-1}{p_2-1} \dots$
- $\log(a \cdot b) = \log(a) + \log(b)$
- $\log(a^x) = x \cdot \log(a)$
- $\log_a(x) = \frac{\log_b(x)}{\log_b(a)}$
- Digit Count of n: $\lfloor \log_{10}(n) \rfloor + 1$
- Arithmetic Progression Sum: $\frac{n}{2} \cdot (a+p), \quad \frac{n}{2} \cdot (2a + (n-1)d)$
- Geometric Sum: $S_n = a \cdot \frac{r^n - 1}{r-1}$
- $(1^2 + 2^2 + \dots + n^2) = \frac{n(n+1)(2n+1)}{6}$
- $(1^3 + 2^3 + \dots + n^3) = \frac{n^2(n+1)^2}{4}$
- $(2^2 + 4^2 + \dots + (2n)^2) = \frac{2n(n+1)(2n+1)}{3}$
- $(1^2 + 3^2 + \dots + (2n-1)^2) = \frac{n(2n-1)(2n+1)}{3}$
- $(2^3 + 4^3 + \dots + (2n)^3) = 2n^2(n+1)^2$
- $(1^3 + 3^3 + \dots + (2n-1)^3) = n^2(2n^2 - 1)$
- For any number n and bases $> \sqrt{n}$, there will be no representation where the number contains 0 at its second least significant digit. So it is enough to check for bases $\leq \sqrt{n}$.
- For some x and y , let's try to find all m such that $x \bmod m \equiv y \bmod m$. We can rearrange the equation into $(x - y) \equiv 0 \pmod{m}$. Thus, if m is a factor of $|x - y|$, then x and y will be equal modulo m .

4 Combinatorics and Probability

4.1 Combinations

```
// Prime Mod in O(n)
void prec() {
    fact[0] = 1;
    for (int i = 1; i < N; i++) {
        fact[i] = 1ll * fact[i - 1] * i % mod;
    }
    ifact[N - 1] = inverse(fact[N - 1]);
    for (int i = N - 2; i >= 0; i--) {
        ifact[i] = 1ll * ifact[i + 1] * (i + 1) % mod;
    }
}

int nCr(int n, int r) {
    if (r > n) return 0;
    return 1ll * fact[n] * ifact[r] % mod
        * ifact[n - r] % mod;
}

int nPr(int n, int r) {
    if (r > n) return 0;
    return 1ll * fact[n] * ifact[n - r] %
        mod;
}
```

4.2 nCr for any mod

```
// Time: O(n^2)
// nCr = (n-1)C(r-1) + (n-1)Cr
for (int i = 0; i < N; i++) {
    C[i][i] = 1;
    for (int j = 0; j < i; j++) {
        C[i][j] = (C[i - 1][j] + C[i - 1][j - 1]) % mod;
    }
}
```

4.3 nCk without mod in O(r)

```
ll nCk(ll n, ll k) {
    double res = 1;
    for (ll i = 1; i <= k; ++i)
        res = res * (n - k + i) / i;
    return (ll)(res + 0.01);
}
```

4.4 Lucas Theorem

```
// returns nCr modulo mod where mod is a prime
// Complexity: ?
ll Lucas(ll n, ll r) {
    if (r < 0 || r > n) return 0;
    if (r == 0 || r == n) return 1;
    if (n >= MOD) {
        return (Lucas(n / MOD, r / MOD) %
            MOD * Lucas(n % MOD, r % MOD) %
            MOD) % MOD;
    }
    return (((fact[n] * invFact[r]) % MOD)
        * invFact[n - r]) % MOD;
}
```

4.5 Catalan Number

```
const int MOD = 1e9 + 7, int MAX = 1e7;
int catalan[MAX];
void init(ll n) {
    catalan[0] = catalan[1] = 1;
```

```
for (ll i = 2; i <= n; i++) {
    catalan[i] = 0;
    for (ll j = 0; j < i; j++) {
        catalan[i] += (catalan[j] *
            catalan[i - j - 1]) % MOD;
        if (catalan[i] >= MOD) {
            catalan[i] -= MOD;
        }
    }
}
```

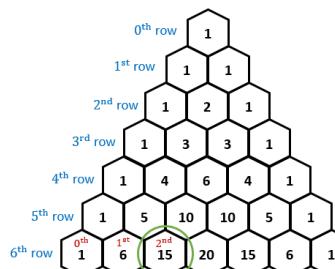

4.6 Derangement

```
// number of combinations such that
// a! = i of a permutation a
const int N = 1e6 + 100, int p = 1e9 + 7;
ll der[N];
void countDer() {
    der[1] = 0;
    der[2] = 1;
    for (ll i = 3; i <= N; ++i) {
        der[i] = (i - 1) % p * (der[i - 1] %
            p + der[i - 2] % p);
        der[i] %= p;
    }
}
```

4.7 Stars and Bars Theorem

- Find the number of k -tuples of non-negative integers whose sum is n . $\binom{n+k-1}{n}$
- Find the number of k -tuples of non-negative integers whose sum is $\leq n$. $\binom{n+k}{k}$
- Combination with Repetition (choose k elements from n objects, same element can be chosen multiple times). $\binom{n+k-1}{k}$
- How many ways to go from $(0,0)$ to (n,m) . $\binom{n+m}{m}$

Pascals Triangle is equivalent to nCr:

4.8 Properties of Pascal's Triangle

- $(a+b)^n = \sum_{k=0}^n \binom{n}{k} a^k b^{n-k}$
- $(k+1)^n = \sum_{i=0}^n k^i \cdot \binom{n}{i}$
- $\sum_{i=0}^n \binom{n}{i} = 2^n$
- $\binom{k}{n} = \frac{k}{n} \binom{k-1}{n-1}$
- $\sum_{k=0}^m \binom{n+k}{k} = \binom{n+m+1}{m}$

- $\binom{n}{0}^2 + \binom{n}{1}^2 + \dots + \binom{n}{n}^2 = \binom{2n}{n}$
- $1\binom{n}{1} + 2\binom{n}{2} + \dots + n\binom{n}{n} = n2^{n-1}$

4.9 Contribution Technique

- Sum of all pair sums: $\sum_{i=1}^n \sum_{j=1}^n (a_i + a_j)$
Every element will be added $2n$ times. $\sum_{i=1}^n (2 \times n \times a_i) = 2 \times n \times \sum_{i=1}^n a_i$.
- Sum of all subarray sums — $\sum_{i=1}^n (a_i \times i \times (n-i+1))$.
- Sum of all Subsets sums — $\sum_{i=1}^n (2^{n-1} \times a_i)$.
- Product of all pair product — $\prod_{i=1}^n (a_i^{2 \times n})$.
- XOR of subarray XORS — How many subarrays does an element have? ($i \cdot (n-i+1)$ times). If subarray count is odd then this element can contribute in total XORs.
- Sum of max minus min over all subset — Sort the array. $Min = 2^{n-i}, Max = 2^{i-1}$. $\sum_{i=1}^n (a_i \cdot 2^{i-1} - a_i \cdot 2^{n-i})$
- Sum using bits — $\sum_{k=0}^{30} (cnt_k[1] \times 2^k)$.
- Sum of Pair XORs — XOR will 1 if two bits are different $\sum_{k=0}^{30} (cnt_k[0] \times cnt_k[1] \times 2^k)$.
- Sum of Pair ANDs — $\sum_{k=0}^{30} (cnt_k[1]^2 \times 2^k)$.
- Sum of Pair ORs — $\sum_{k=0}^{30} ((cnt_k[1]^2 + 2 \times cnt_k[1] \times cnt_k[0]) \times 2^k)$.
- Sum of Subset XORs — where $cnt0! = 0$ $\sum_{k=0}^{30} (2^{cnt_k[1]+cnt_k[0]-1} \times 2^k)$.
- Sum of Subset ANDs — $\sum_{k=0}^{30} ((2^{cnt_k[1]} - 1) \times 2^k)$.
- Sum of Subset ORs — $\sum_{k=0}^{30} ((2^n - 2^{cnt_k[0]}) \times 2^k)$.
- Sum of subarray XORs — Convert to prefix xor, then solve for pairs.
- Sum of product of all subsequence — $\prod_{i=1}^n (a_i + 1) - 1$. Example array — $[a, b]$ the subsequences are $\{a\}, \{b\}, \{a, b\}$ so ans is $a + b + (a \cdot b)$

4.10 Probability and Expected Value

- Expected Value: $E = \frac{\text{Sum of all possible values}}{\text{Total number of outcomes}}$
- Expected Value: $E = \sum_{i=1}^n P_i \cdot i$
- Variance: $V(x) = E(x^2) - \{E(x)\}^2$
- Expected Value with DP: $E(i) = \sum P(i \rightarrow j) \times (R(i \rightarrow j) + E(j))$ Where $R()$ is Immediate Reward(cost/count)
- Linearity of Expectation:

$$\begin{aligned} - E[X+Y] &= E[X] + E[Y] \\ - E[\text{Total}] &= E[I_1] + E[I_2] + \dots = \sum P(I_i = 1) \end{aligned}$$

We need to define the Indicator Random Variable (I) correctly. Some Examples below —

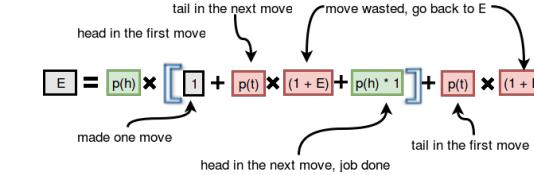

Problem-1: Find $E[\text{correct hats}]$ in a random permutation. Indicator I_i : "Does person i get their own hat?"

Problem-2: Find $E[\text{total inversions}]$ in a random permutation. Indicator I_{ij} : "Is pair (i, j) an inversion?"

Problem-3: Given a string S , delete a random index until it becomes empty. Find the expected count of palindromes seen (exclude S , include empty string). Indicator I_L : "Is the string of length L a palindrome?"

Problem-4: Pick N random integers from $[1, k]$. Merge consecutive equal values (e.g., $1, 1, 2, 2, 1, 1 \rightarrow 1, 2, 1$). Find the expected final length. Indicator I_i : "Is item i different from item $i-1$?"

- To get two consecutive heads, what is the expected number of tosses?

To get n heads, what is the expected number of tosses? Let's define: to get n heads, we need to toss $E(n)$ times. Now — I can get a head; I need to toss $E(n-1)$ more times, or if I get a tail; I need to toss $E(n)$ times. So, the recurrence is: $E(n) = 0.5 \cdot (1 + E(n-1)) + 0.5 \cdot (1 + E(n))$

- You have n bulbs, all of which are initially off. In each move, you randomly select one bulb. If the selected bulb is off, you toss a coin:

- If you get head, you turn it on.
- If you get tail, you do nothing.

If the bulb is already on, you skip that move (nothing happens).

Now, what is the expected number of moves required to turn all bulbs on?

The coin is not fair — the probability of getting tail is p . This problem can also be solved recursively.

Let's assume at some moment, x bulbs are already on, and the expected number of moves needed from here is $e(x)$.

The probability of picking an already on bulb is $\frac{x}{n}$. In that case, the expected number of moves is $\frac{x}{n} \times (1 + e(x))$.

The probability of picking an off bulb is $\frac{n-x}{n}$.

Now two things can happen:

- With probability p , you get tail, so you stay at the same state ($e(x)$ more moves).
- With probability $(1-p)$, you get head, so one more bulb turns on ($e(x+1)$ moves from there).

So, the recurrence relation is:

$$e(x) = \frac{x}{n}(1 + e(x)) + \frac{n-x}{n}(p(1 + e(x)) + (1-p)(1 + e(x+1)))$$

5 Data Structure

5.1 Next Greater using Stack

```
stack<pair<int, int>> st;
    int right[n+1]; // a[i] is maximum
    for (int i = 1; i <= n; i++) {
        while (!st.empty() and st.top().first < a[i]) {
            right[st.top().second] = i - 1;
            st.pop();
        }
        st.push({a[i], i});
    }
    while (!st.empty()) {
        right[st.top().second] = n;
        st.pop();
    }
```

5.2 Segment Tree Lazy

```
struct ST {
    int tree[4 * N], lazy[4 * N];
    void push(int n, int b, int e) {
        if (lazy[n] == 0) return;
        tree[n] += lazy[n] * (e - b + 1); // change here
        if (b != e) {
            int l = n << 1, r = l + 1;
            lazy[l] += lazy[n]; // change here
            lazy[r] += lazy[n]; // change here
        }
        lazy[n] = 0;
    }
    void build(int n, int b, int e) {
        lazy[n] = 0;
        if (b == e) {
            tree[n] = a[b]; // change here
            return;
        }
        int mid = (b + e) >> 1, l = n << 1, r = l + 1;
        build(l, b, mid);
        build(r, mid + 1, e);
        tree[n] = tree[l] + tree[r]; // change here
    }
    void upd(int n, int b, int e, int i, int j, int x) {
```

```
push(n, b, e);
if(b > j || e < i) return;
if(b >= i && e <= j) {
    lazy[n] += x; // change here
    push(n, b, e);
    return;
}
int mid = (b + e) >> 1, l = n << 1,
r = l + 1;
upd(l, b, mid, i, j, x);
upd(r, mid + 1, e, i, j, x);
tree[n] = tree[l] + tree[r]; // change here
}
```

```
} st;
```

5.3 First Element Greater than K in a Range

```
// tree[n] = max in range
int get_first(int n, int b, int e, int i, int j, int x) { // return index
    push(n, b, e);
    if (b > j || e < i) return -1;
    if (tree[n] <= x) return -1;
    if (b == e) return b;
    int mid = (b + e) >> 1, l = n << 1, r = l + 1;
    int left = get_first(l, b, mid, i, j, x);
    if (left != -1) return left;
    return get_first(r, mid + 1, e, i, j, x);
}
```

5.4 Number of Unique Element in a Range

```
vector<pair<int, int>> Q[QQ];
int main() {
    int n; cin >> n;
    for(int i = 1; i <= n; i++) cin >> a[i];
    int q; cin >> q;
    for(int i = 1; i <= q; i++) {
        int l, r; cin >> l >> r;
        Q[r].push_back({l, i});
    }
    st.build(1, 1, n); // range sum and point add
    map<int, int> last_idx;
    for(int r = 1; r <= n; r++) {
        if(last_idx.find(a[r]) != last_idx.end()) {
            st.upd(1, 1, n, last_idx[a[r]], -1);
        }
```

```
}
```

5.5 Max Subarray Sum in a Range

```
struct node {
    ll tot_sum;
    ll prefix_max, suffix_max;
    ll max_subarray_sum;
};
node merge(node l, node r) {
    if (l.tot_sum == -inf) return r;
    if (r.tot_sum == -inf) return l;
    node ans;
    ans.max_subarray_sum =
        max(l.max_subarray_sum,
             r.max_subarray_sum);
    ans.max_subarray_sum =
        max(ans.max_subarray_sum,
             l.suffix_max + r.prefix_max);
    ans.tot_sum = l.tot_sum + r.tot_sum;
    ans.prefix_max = l.prefix_max;
    if (l.tot_sum + r.prefix_max >=
        l.prefix_max) {
        ans.prefix_max = l.tot_sum +
            r.prefix_max;
    }
    ans.suffix_max = r.suffix_max;
    if (r.tot_sum + l.suffix_max >=
        r.suffix_max) {
        ans.suffix_max = r.tot_sum +
            l.suffix_max;
    }
    return ans;
}
```

5.6 Count of subarrays such that their XOR is 0 in a range with upd

```
struct node {
    int cnt[64];
    node() {
        memset(cnt, 0, sizeof cnt);
    }
};
struct ST {
    node tree[4 * N]; int lazy[4 * N];
    void push(int n, int b, int e) {
        if (lazy[n] == 0) return;
        for (int k = 0; k < 64; k++) {
            if ((k ^ lazy[n]) > k) {
                swap(tree[n].cnt[k],
                      tree[n].cnt[k ^ lazy[n]]);
            }
        }
        if (b != e) {
            int l = n << 1, r = l + 1;
            lazy[l] ^= lazy[n];
            lazy[r] ^= lazy[n];
        }
        lazy[n] = 0;
    }
    void build(int n, int b, int e) {
        if (b == e) {
            tree[n].cnt[0] = 1;
            return;
        }
        int mid = (b + e) >> 1, l = n << 1, r = l + 1;
        build(l, b, mid);
        build(r, mid + 1, e);

 int R = query(r, mid + 1, e, i, j, k);
 return (L + R);
 }
}

```

```

```

} mst;

### 5.8 Sparse Table

---

```

const int N = 2e5 + 9, K = 20; // change here
int a[N], tree[N][K];
int log2_floor(unsigned long long i) {
 return i ? __builtin_clzll(1) -
 __builtin_clzll(i) : -1;
}
void build(int n) {
 for (int i = 1; i <= n; i++) {
 tree[i][0] = a[i];
 }
 for (int k = 1; k < K; k++) {
 for (int i = 1; i + (1 << k) - 1 <=
 n; i++) {
 tree[i][k] = min(tree[i][k - 1],
 tree[i + (1 << (k - 1))][k - 1]); // change here
 }
 }
}
int query(int l, int r) {
 int k = log2_floor(r - l + 1);
 return min(tree[l][k], tree[r - (1 << k) + 1][k]); // change here
}
build(n);

5.9 DSU

```

struct DSU {
    vector<int> par, sz;
    int c;
    DSU(int n) {
        par.resize(n + 1), sz.resize(n + 1,
                                     1);
        for (int i = 1; i <= n; i++) {
            par[i] = i;
        }

    }
    cout << component_cnt - 1 << '\n';
}

```

7.12 [Problem] Rooted Tree - Hackerrank

Given a rooted tree, Upd: Add $d * k$ on v (subtree nodes of u), where k will be given and d is distance of v from u . Query: Node Value/Subtree Sum (using ETT) or Path Value Sum (using HLD). **Idea:** $d_i = \text{dis from root to } i$. Then, $\text{ans} = k \cdot \sum_{v \in \text{subtree}(u)} d_v$. It's hard to find d_v for each u , rather we can find $d_v = \text{dis of } v \text{ from root}$. Although some extra value added on each v of subtree u because of d_v from root (not u), we can easily subtract them ($\text{depth}[u] * k$).

7.13 Dinic

```

const int N = 105, inf = 1e9;
int n, m, st, en;
// Edges should be added in both
// direction separately if the graph is
// undirected
const int INF = 2000000000;

    cnt = t4.GT(m + 1, r, k);
    ans += 1ll * k * cnt;
    cout << ans << '\n';
}

```

It is easier to explain by considering only palindromes centered at indices (so, odd length), the idea is the same anyway. For each index i , r_i will be the longest radius of a palindrome centered there (in other words, the amount of palindromes centered at index i). Directly from manacher, this takes $\mathcal{O}(n)$ to calculate.

For a query $[l, r]$, we first compute $m = \frac{l+r}{2}$. Now we want to calculate

$$\sum_{i=l}^m \min(i-l+1, r_i) + \sum_{i=m+1}^r \min(r-i+1, r_i)$$

$$\sum_{i=l}^m \min(i-l+1, r_i) = \sum_{i=l}^m i + \min(1-l, r_i - i).$$

The sum over i can be found in constant time. As for the other term, if we create some array $r'_i = r_i - i$ during the preprocessing, then the queries are asking for some over range of $\min(C, r'_i)$ where C is constant. You can solve this in $\mathcal{O}(\log n)$ per query using wavelet tree.

8.10 Trie

```

const int N = 10; // change here
const char base_char = '0'; // change
here
struct TrieNode {
    int cnt;
    TrieNode *nxt[N];
    TrieNode() {
        cnt = 0;
    }
}

```

```

for (int i = 0; i < N; i++) nxt[i] =
    NULL;
}
}*root;
void insert(const string &s) {
    TrieNode *cur = root;
    int n = (int)s.size();
    for (int i = 0; i < n; i++) {
        int idx = s[i] - base_char;
        if (cur -> nxt[idx] == NULL) cur ->
            nxt[idx] = new TrieNode();
        cur = cur -> nxt[idx];
        cur -> cnt++;
    }
}
void rem(TrieNode *cur, string &s, int pos) { // free :: De Alloactes Memory
    if (pos == s.size()) return;
    int idx = s[pos] - base_char;
    rem(cur -> nxt[idx], s, pos + 1);
    cur -> nxt[idx] -> cnt--;
    if (cur -> nxt[idx] -> cnt == 0) {
        free(cur -> nxt[idx]);
        cur -> nxt[idx] = NULL;
    }
}
int query(const string &s) { // "s" is a
    prefix of some element or not
    int n = (int)s.size();
    TrieNode *cur = root;
    for (int i = 0; i < n; i++) {
        int idx = s[i] - base_char;
        if (cur -> nxt[idx] == NULL) return 0;
        cur = cur -> nxt[idx];
    }
    return cur -> cnt;
}
void del(TrieNode *cur) {
    for (int i = 0; i < N; i++) if (cur ->
        nxt[i]) del(cur -> nxt[i]);
    delete(cur);
}
int32_t main() {
    root = new TrieNode(); // init new trie
    del(root); // clear trie
}

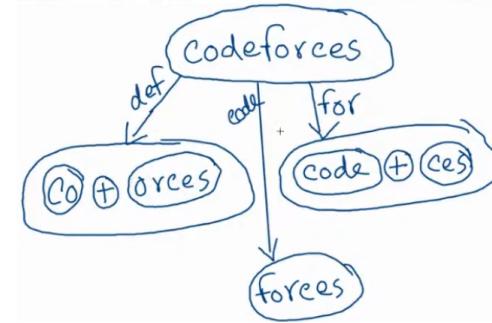

```

9 Game Theory

9.1 Notes

- First Write a Bruteforce Solution
- If game is not impartial. Greedy, DP may work
- Nim = All XOR
- Misere Nim (Last player who took a stone loses) = Nim + (Corner Case: if all (odd) piles are 1 you lose)
- Bogus Nim = Nim
- Staircase Nim (Given an array where $a[i]$ is the number of stones at index i . Move: Choose any stones (> 1) from index i ($i > 1$) and move them to index $i-1$.) = Odd indexed pile Nim (Even indexed pile doesn't matter, as one player can give bogus moves to drop all even piles to ground)

- Sprague-Grundy:** Every impartial game under the normal play convention is equivalent to a ONE-HEAP GAME of NIM.
Grundy value can be calculate by DP/Pattern.

10 Misc.

10.1 [Trick] Median of Medians

Problem: Median of All Sub-Array Medians

Idea: Total Subarray, $k = \frac{n(n+1)}{2}$. We need all subarray medians, sort them and get $\frac{k}{2} + 1$. Now, Binary Search on Answer. `ok()` will return true if $cnt \geq \frac{k}{2} + 1$, where cnt = count of subarrays whose median is $\leq mid$. If true, $r = mid - 1$

10.2 Ternary Search

```

// Problem: Pyramid-ICPC Dhaka 2023
// Given the surface area of a square
// base pyramid, Need to maximize
// volume.
double surface_area;
double fun(double square_area) {
    double base = sqrt(square_area);
    double triangle_area = surface_area -
        square_area;
    double per_triangle_area =
        triangle_area / 4;
    double triangle_height =
        (per_triangle_area * 2) / base;
    double x = base / 2;
    double height = sqrt((triangle_height *
        triangle_height) - (x * x));
    double volume = (base * base * height)
        / 3;
    if (x > triangle_height) volume = 0;
    return volume;
}
int32_t main() {
    cin >> surface_area;
    double l = 0, r = surface_area, ans = -1;
    int it = 100;
    while (it--) {
        double mid1 = l + (r - l) / 3;
        double mid2 = r - (r - l) / 3;
        double x = fun(mid1);
        double y = fun(mid2);
        if (x > y) {
            ans = x;
        }
    }
}

```

```

r = mid2;
}
else l = mid1;
}

10.3 Pigeonhole Principle

```

- At least 1 subarray of an array of length N must be divisible by N .
- Build all possible sequences of length 10 whose value is between 1 to 100. At least any two sequences will be same.
- For $N \geq 100$, at least one 4-tuples XOR is 0.
- For $N > 20$ and $a_i \leq 10^6$, at least two subsets has same XOR. Because distinct XOR count can be 10^6 and Total Subset $2^{20} > 10^6$. Means there is a subset whose XOR is 0.

10.4 Matrix Expo

```

struct Mat {
    int n, m;
    vector<vector<int>> a;
    Mat() {}
    Mat(_n, _m) {n = _n; m = _m;
        a.assign(n, vector<int>(m, 0));}
    Mat(vector<vector<int>> v) {n =
        v.size(); m = n ? v[0].size() : 0;
        a = v; }
    inline void make_unit() {
        assert(n == m);
        for (int i = 0; i < n; i++) {
            for (int j = 0; j < n; j++) {
                a[i][j] = i == j;
            }
        }
    }
    inline Mat operator + (const Mat &b) {
